

# MyKeyboard

## Promotional Material

MyKeyboard is a new keyboard for iOS, offering many advanced features, such as:

- A Keyboard Builder for easily creating custom keyboard layouts
- An advanced Keyboard Editor for freely changing keys, rows, actions, subkeys and more
- An advanced Theme Editor for creating highly customized keyboard themes
- A quick deletion mode where swiping left will delete text and swiping right will restore it
- Smart Emoji suggestions matching the currently typed word
- A special Contact key for quick access to personal information (address, name, email, etc.)

All of these features allow for endless customization by power-users, while still ensuring that less technically proficient users can still easily do simple customization using the beginner-friendly “Keyboard Builder” and predefined themes.

Features like the “Quick-Deletion Mode”, which is enabled by default, make common tasks like deleting text a lot faster, regardless of whether it’s just a few characters or multiple words at once.

The free base theme is similar to the iOS system keyboard to give users a feeling of familiarity. Two other free themes are offered in the beginning, immediately welcoming the user to a world of personalization and customization.

Internally, MyKeyboard is built on top of the Swift + SwiftUI stack, with a very small amount of Objective C code for obtaining CPU usage (only used internally for debugging purposes).

We started beta testing the app on February 6th, 2021. The release date is set for April 1st, 2021.
